Co-Presenter

Brian Smith

Delaware Department of Transportation (DelDOT) has recently deployed Information Network For Online Resource Mapping (INFORM), a Web application to consolidate the dissemination of spatial data. INFORM presents an easy-to-use interface that requires little to no training for users and no software plug-ins for client machines. It allows users to access critical business data in as little as three mouse clicks. GeoDecisions developed INFORM on the latest ESRI ArcIMS platform with SDE 9 and Oracle 9i powering the data.

INFORM displays data from a number of business systems including Maximo, Primavera, and VisualPMS. Other enterprise transportation data includes accident, road, bridge, transit, environmental, and base map features. INFORM gives users the ability to display a number of base map features at any time, as well as the ability to create multiple thematic maps based on business data. INFORM also has a completely customized legend and user-defined printing capabilities.
