N/A

Geospatial information is crucial to the military's success in the Global War on Terrorism. Imagery acquired from several different sensors and platforms and at varying resolutions has been used to produce geospatial imagery intelligence products in support of Operations NOBLE EAGLE, ENDURING FREEDOM, and IRAQI FREEDOM.

Successful applications require readily available imagery and a suite of image processing and geographic information system (GIS) tools along with highly skilled analysts. Products were produced and disseminated to active Army units, Army Reserve and National Guard units, and to several units in other services. Examples of typical products and their application will be presented.
