Co-Presenter

It is becoming increasingly important to utilize GIS information for infrastructure planning and design decisions. Typically the analysis is performed in a traditional GIS environment and design in a CADD environment. This session will demonstrate an integrated CAD-GIS workflow that brings GIS information in to the CAD environment. Using Bentley geospatial solutions that work within the MicroStation CAD environment, GIS data such as SHP files can be incorporated as part of the design. The session will show how GIS and CAD data can be combined for analysis and planning purposes, and can be used to create powerful presentations, including exporting the projects to Google Earth.
