There are a multitude of sources of digital imagery available to Transportation Agencies today. These sources can benefit most if not all departments during different phases of a project within the agencies from planning, design, maintenance and emergency management. The challenge is how to efficiently manage and distribute that imagery to users throughout their organization while minimizing IT requirements and maximizing the distribution of the imagery. Intergraph's TerraShare product allows these organizations to accomplish these goals.

This presentation will cover how several Transportation Agencies are utilizing their imagery more efficiently than ever before throughout their organizations. Users can now access hi-res imagery in seconds and find their area of interest without having to waste time searching through hundreds of individual image files. Users can now natively exploit gigabytes of imagery instantly within their working applications like MicroStation and render results for public review directly into Google Earth. Learn how Transportation Agencies are cutting project delivery schedules by being more productive with imagery available 24-7 and instantly to all users.
