**Co-Presenter**

GIS technology is a constantly moving target. "Cloud Computing" is replacing "Service Oriented Architecture" as the latest buzz for GIS development. The Kentucky Transportation Cabinet's (KYTC) GIS continues to evolve to serve its internal and external customers. For almost two decades, the Cabinet has grown GIS through a trajectory of base data creation to simple stovepipe solutions to greater and greater data integration across traditional lines (tabular/spatial, agency boundaries, etc.). This presentation discusses our evolution and what we've learned, where we are today, and where our future development is focused.
