The New Hampshire Department of Transportation (NHDOT) has implemented an automated, Web-based Route Logs (also known as straight-line diagrams) system to promote agency wide business data display and analysis. The application builds upon the system originally developed for the Vermont Agency of Transportation (VTrans), with additional functionality and customization. In this presentation, NHDOT staff will detail the past history of straight-line diagram use at the agency, the process of upgrading from the paper product to interactive computer-based system, and then demonstrate the application. We will also detail the system design and uses of the application so far. To conclude, we will discuss ongoing and future enhancements.
