Co-Presenter

The Highway Route Log (HRL) is a web based application that allows users to view spatially related roadway information along numbered routes. Roadway characteristics are displayed through the use of orthographic images, graphic representation and tabular displays. All graphic and tabular displays depicting road inventory information are dynamically connected to data sources updated daily and arranged on a single page providing users with a compact but data rich reporting tool.

For a more complete description of this application, please contact me for the *.PDF files created to notify staff of this innovative application. Training materials have already been developed and utilized, but can be amended for a broader audience.
