Jesse Jay
GeoDecisions

Oklahoma DOT and GeoDecisions have integrated VideoLog into the Geographical Resource Intranet Portal (GRIP). With this GRIP enhancement, the GRIPv3 user can initialize the Roadware VisiWeb application from the GRIPv3 web application. Initialization is based on geographic location along a roadway in order to access the desired image(s).

The new GRIP function (s) will:

- Initialize Video from the Attribute form.
- Initialize Video from the map toolbar.
- Pass parameters to VisiWeb to determine the correct image set.
- Receive X.Y back from VisiWeb.
- Move new video symbol on map, track video

This new video access from GRIP makes important roadway images accessible via the intranet and therefore available to a wider base of ODOT users. This new enhancement not only increases the value of GRIP to ODOT but now combines data analysis with data collection for all DOT users. This GIS-T presentation will demonstrate the new VideoLog functionality and illustrate its value to ODOT.
