Co-Presenter

To make the giant leap to integrating the enterprise takes many small steps. Since 2000, TxDOT has added technology, improved skill sets, and updated business processes to integrate non-spatial and spatial data within and across business units. TxDOT's Main Street Texas (MST) integration software combines the powers of both SQL query and spatial intersect. Mixing legacy and new data models allows MST to catalog data and applications so pieces are interchangeable. These aspects of MST ease the gathering and creation of information for decision making and integration.
