Co-Presenter

Steve Lewis
USDOT/BTS

As part of the Geospatial One-stop (GOS) effort, the BTS has been managing the development of core data content standards for transportation data. Last year at this conference, we presented the standards that were developed for air, rail, road and transit. This year, we will describe how the separate standards were "harmonized" into a single transportation standard and submitted to ANSI for approval. In addition, we will update the progress of the GOS Transportation Pilot portal. The Transportation Pilot Portal is the first real implementation of GOS standards.
