Co-Presenter

Transportation agencies globally own or manage very large real property holdings over geographically dispersed territories. Information about these assets is spread across the enterprise in a number of often disparate legacy systems - and across different offices. These strategic information inefficiencies make it costly and often impractical to obtain an accurate real-time view of the state of real property assets, and activities related to them. The challenges presented by right-of-way (ROW) planning and acquisition initiatives magnify the challenges that exist in stove-piped right of way planning and real property intelligence systems. This presentation will present strategies and solutions engineered to streamline, integrate and automate right-of-way planning, ROW acquisition, ROW management, real property intelligence and real property information value chains across the Enterprise.
