**Co-Presenter**

The creation of Florida's Strategic Intermodal System (SIS) program resulted in the need for new methodologies and tools to support the consistent prioritization of projects across the state. While the Department has used several analytical programs to assist in the prioritization analysis within the Central Office, the need to make these analyses available to users throughout the Department, including district offices has resulted in the development of the Strategic Investment Tool. The SIT utilizes ArcGIS and ArcGIS Server technologies and consists of three primary modules. These modules are designed to help guide planners and engineers in improvement decisions that best meet the five principal goals outlined in the SIS objectives. The purpose of this presentation is to demonstrate the SIT modules and describe how they fit into the overall vision of the SIS program.
