

**Ministry of Transportation Ontario**  
**Highway 6, 11 & 17 - Corridor Assessment**  
**Debbie Burns, Paul Church** (Presented by Rich Garcia, GISP)

April 7, 2009

# Outline of Presentation

1. Introduction
2. Scope & Objectives
3. Data Collection
4. Asset Extraction
5. Data Model

# Introduction

## Project Description

Preliminary Design Assignment to:

- Collect data for approximately 1,180 centerline miles of Highway 6, 11 and 17;
- Review geometric and operational deficiencies, roadway assets, traffic data; and
- Develop a model to estimate lifecycle and deficiency costs over a 25 year timeframe.

# Data Collection

Mobile Data Capture – What's on the Truck?

# Data Collection

## Mobile Data Capture

# Data Collection

## Mobile Data Capture

# Data Collection Results

- High resolution digital video log for Highway's 6, 11 & 17 in both directions, approximately 4,000 km
- Two (left and right) camera images collected at 5m intervals
- Each image geo-referenced to accurately locate the X, Y, and Z coordinates of the asset features within the right-of-way
- Sub-metre accuracy GPS collected
- ~500 GB of video ready for the asset extraction process
- ~500 GB of LiDAR data

# Data Collection Results

The collected video and GPS provided the ability to extract the following assets:

- Concrete Barriers
- Clear Zones (Rock Cuts)
- Intersections
- Paved Shoulders
- Guiderail
- Curb and Gutter
- Catch Basins
- Entrances
- Auxiliary Lanes
- Crossings
- Linear Passing Zones
- Lane Width Measurements

# Asset Extraction

## Definition

- Asset extraction is the exercise of collecting spatial and physical information of assets.
- The principle software used in the asset extraction process is Geo-3D's Trident 3-D Analyst software with the use of collected video and GPS coordinate information.

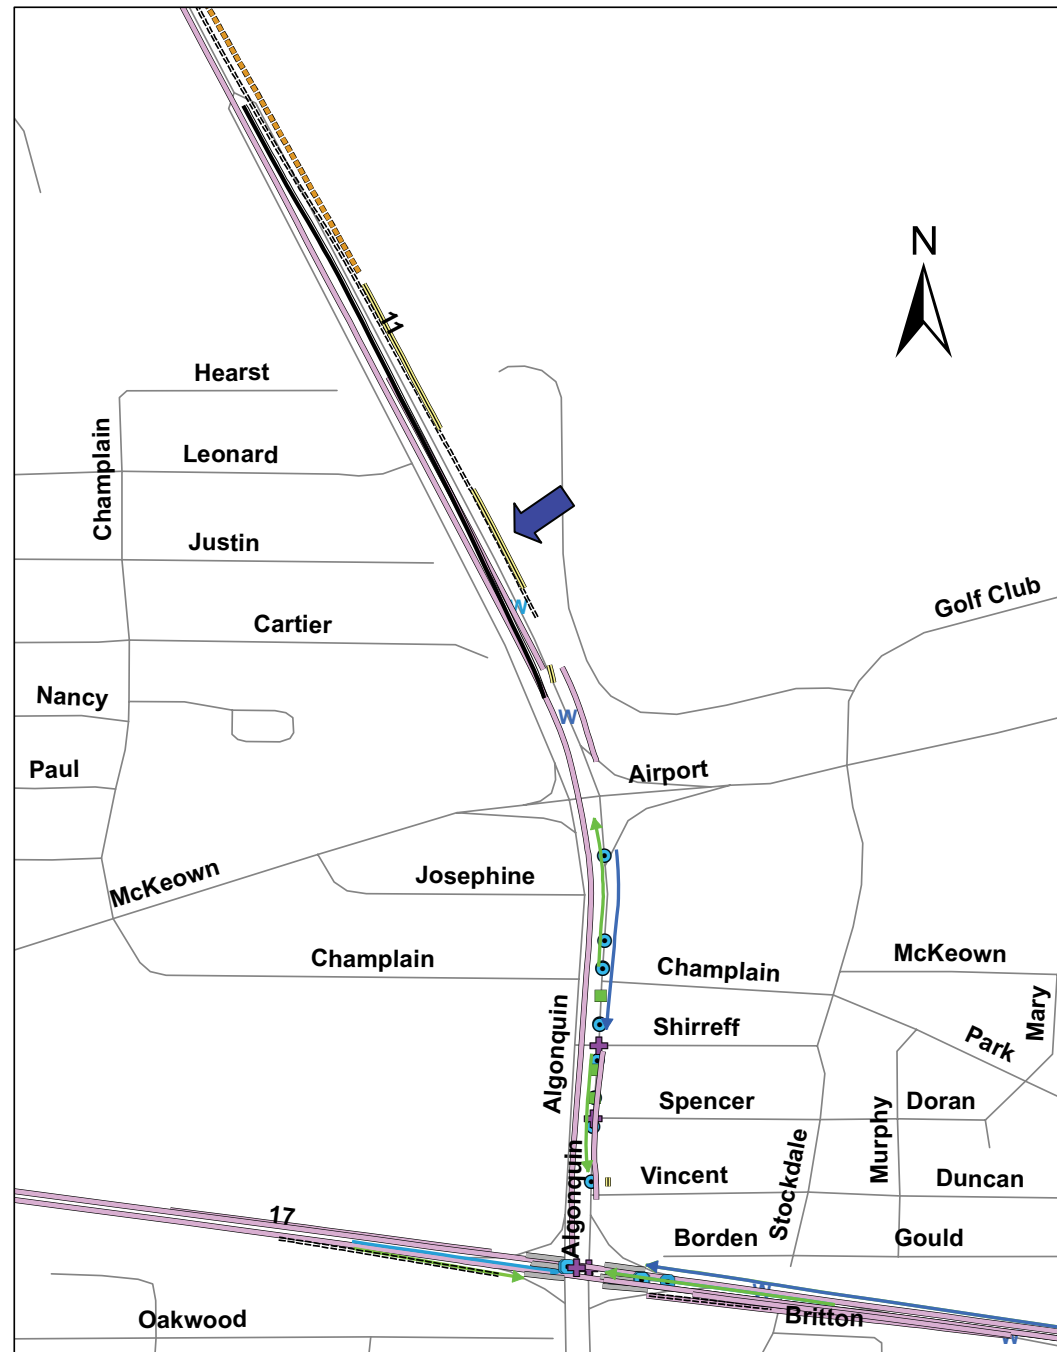

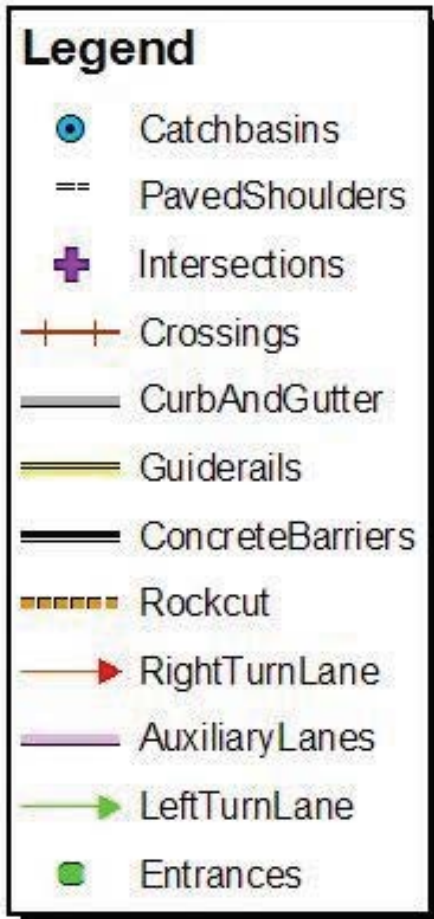

Let's look at an example...

# Asset Extraction

# Asset Extraction

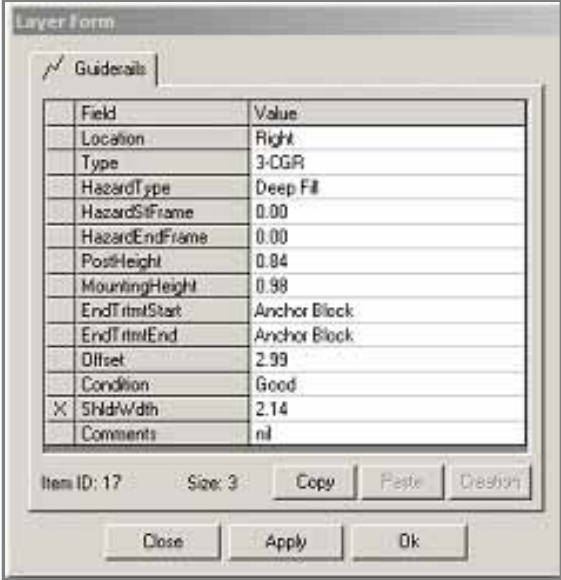

## Example Results

# Asset Extraction

## Guiderail Attributes Extracted

- Guiderail type
- Location
- Condition
- End treatment type
- Hazard type
- Mounting and post heights
- Offset
- Shoulder width

The screenshot shows a 'Layer Form' dialog box with a 'Guiderails' tab. It contains a table with the following data:

| Field          | Value        |
|----------------|--------------|
| Location       | Right        |
| Type           | 3-CGR        |
| HazardType     | Deep Fill    |
| HazardStFrame  | 0.00         |
| HazardEndFrame | 0.00         |
| PostHeight     | 0.84         |
| MountingHeight | 0.98         |
| EndTmtStart    | Anchor Block |
| EndTmtEnd      | Anchor Block |
| Offset         | 2.99         |
| Condition      | Good         |
| SHdWidth       | 2.14         |
| Comments       | nil          |

Below the table, there are fields for 'Item ID: 17' and 'Size: 3', along with 'Copy', 'Paste', and 'Destroy' buttons. At the bottom of the dialog are 'Close', 'Apply', and 'Ok' buttons.

# Quality Assurance

- Each asset type is described in detail in the project Asset Extraction Manual.
- During the extraction process, any cases where the technician was uncertain about a particular asset or attribute encountered, a field called “Supervisor Check” was used and later reviewed by the supervisor.
- All extracted assets were verified for location and attribute accuracy via ESRI’s ArcMap.
- Any anomalies or questionable assets were verified and reviewed using Trident 3-D Analyst.

# Quality Assurance

In addition to reviewing all Comments, the data was subjected to a series of logical queries in order to locate as many anomalous values as possible.

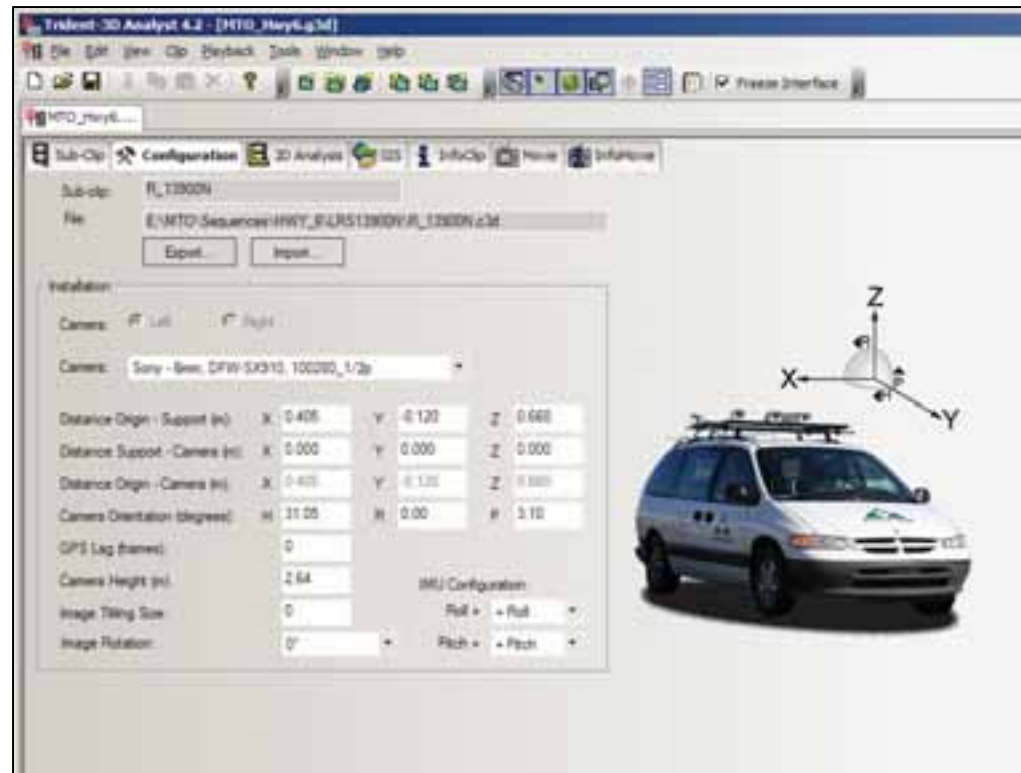

Some examples of logical queries are:

- Clear zone width > 15 m
- Guiderail mounting heights higher than post heights and post heights greater than 2 m height
- Missing data such as Location, Type, etc.
- A linear feature (e.g. Guiderail) with no defined end point

# Asset Extraction

## Video & GPS - Calibration

The technician loaded an associated camera calibration file for each video file so that the position of each camera relative to the location defined by the GPS unit could be calculated within the software.

# Asset Extraction Results

**Highway 6**  
1,438 Assets

**Highway 11**  
9,863 Assets

**Highway 17**  
15,014 Assets

# Asset Extraction

## Results for Highway 6

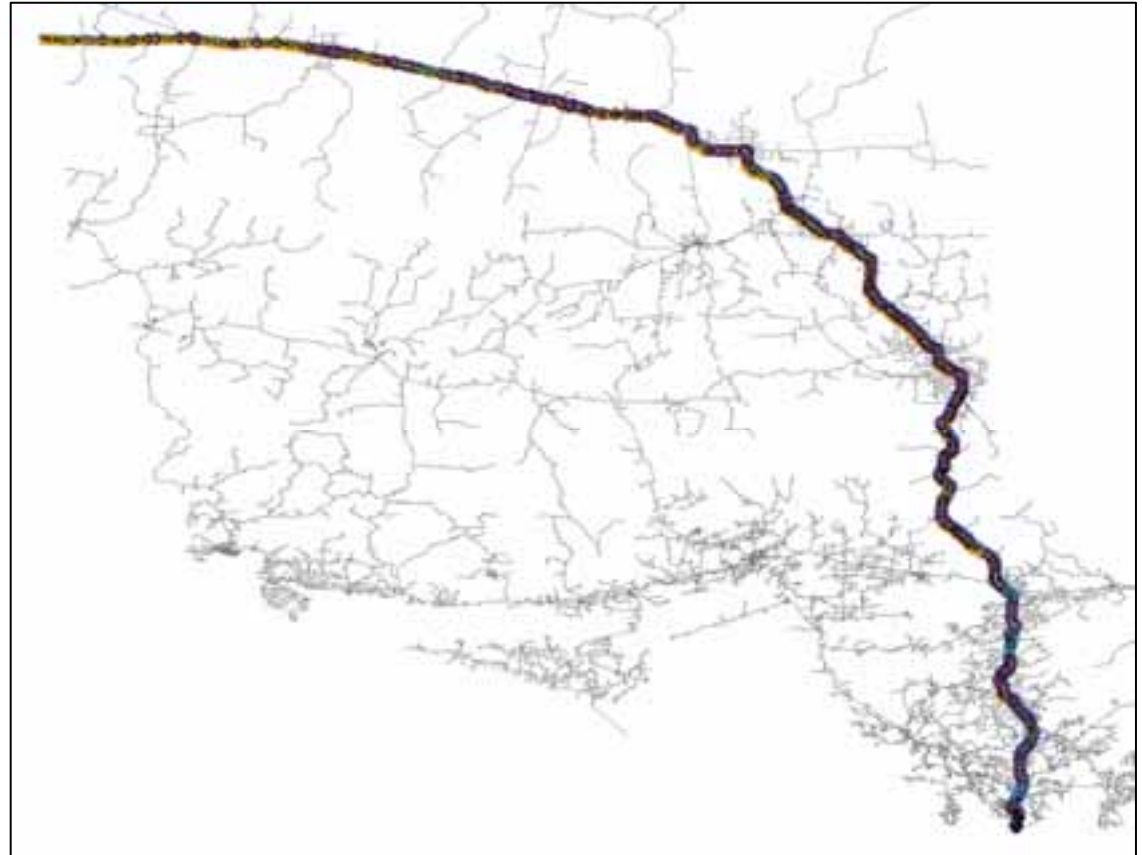

- 5 Concrete Barriers
- 224 Clear Zones (Rock Cuts)
- 127 Intersections
- 29 Paved Shoulders
- 140 Guiderail
- 76 Curb and Gutter
- 32 Catch Basins
- 455 Entrances
- 17 Auxiliary Lanes
- 4 Crossings
- 84 Linear Passing Zones
- 245 Lane Width Measurements

# Asset Extraction

## Results for Highway 11

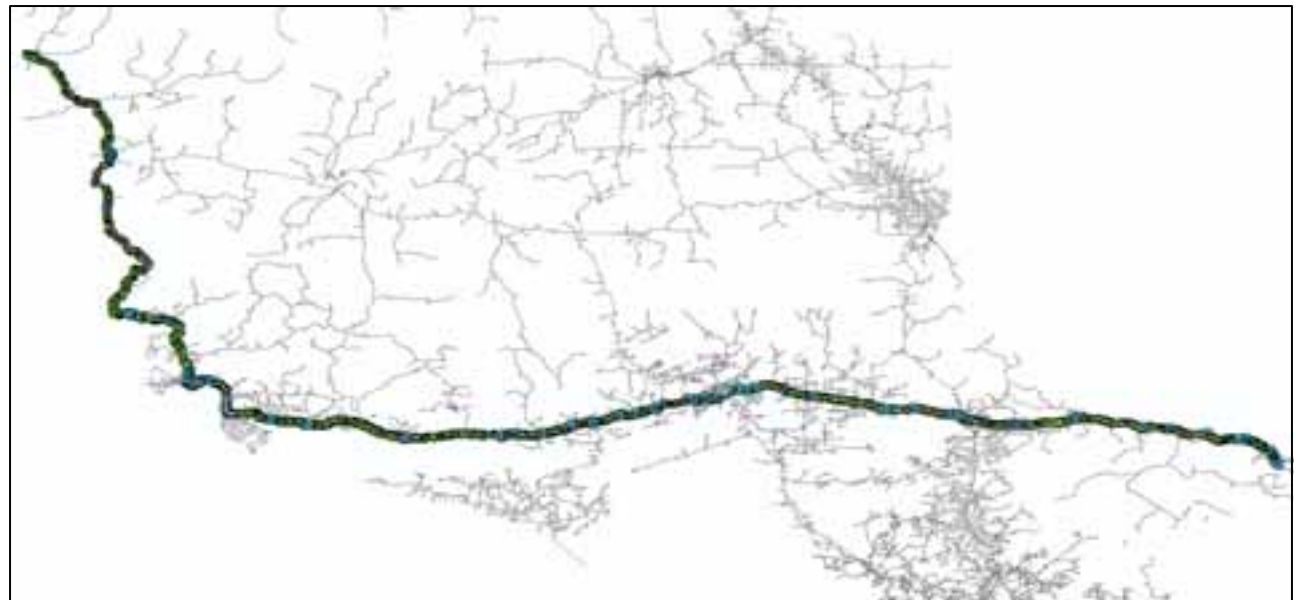

157 Concrete Barriers  
877 Clear Zones (Rock Cuts)  
493 Intersections  
229 Paved Shoulders  
1,343 Guiderail  
452 Curb and Gutter  
303 Catch Basins  
3160 Entrances  
198 Auxiliary Lanes  
11 Crossings  
592 Linear Passing Zones  
1,839 Lane Width Measurements

# Asset Extraction

## Results for Highway 17

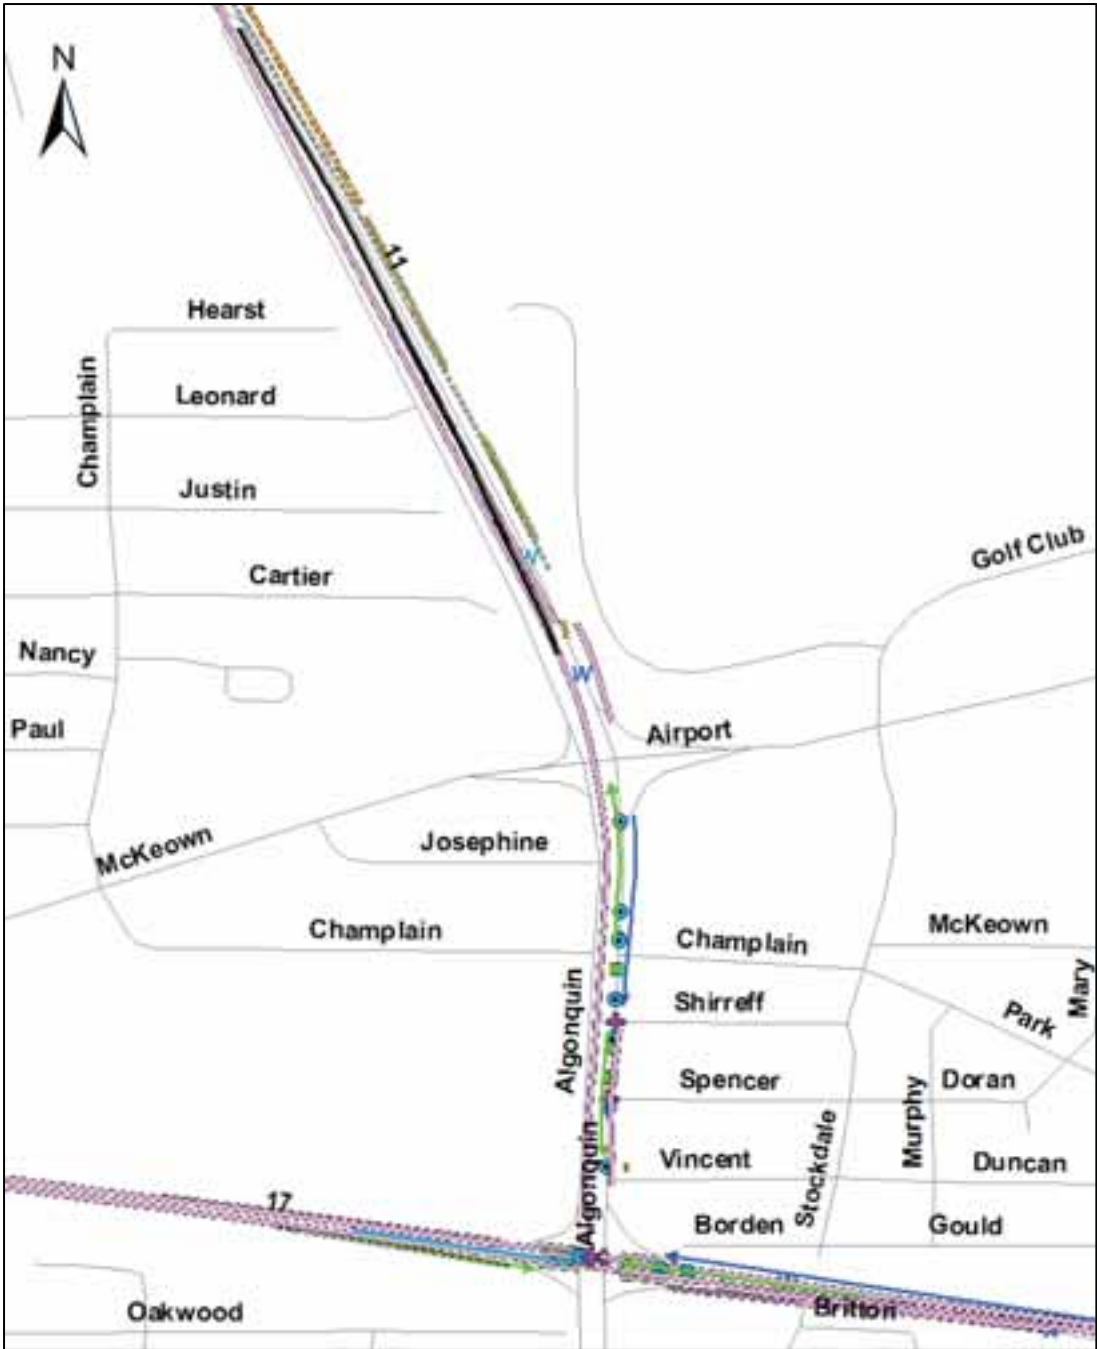

- 137 Concrete Barriers
- 1,953 Clear Zones (Rock Cuts)
- 649 Intersections
- 655 Paved Shoulders
- 1,926 Guiderail
- 648 Curb and Gutter
- 720 Catch Basins
- 4,168 Entrances
- 281 Auxiliary Lanes
- 35 Crossings
- 1,926 Linear Passing Zones
- 1,916 Lane Width Measurements

# Asset Extraction Results for Highway 11

**Legend**

-  Catchbasins
-  PavedShoulders
-  Intersections
-  Crossings
-  CurbAndGutter
-  Guiderails
-  ConcreteBarriers
-  Rockcut
-  RightTurnLane
-  AuxiliaryLanes
-  LeftTurnLane
-  Entrances

# Data Extraction

The deliverable for the data model was GIS shape files for the following assets, ready for input into the model.

- Concrete Barriers
- Clear Zones (Rock Cuts)
- Intersections
- Paved Shoulders
- Guiderail
- Curb and Gutter
- Catch Basins
- Entrances
- Auxiliary Lanes
- Crossings
- Linear Passing Zones
- Lane Width Measurements

# Data Extraction

## Other Possible Assets

Other Assets that could be collected in the future:

- Signs
- Supports
- Luminaires
- Traffic Signals
- Pavement Markings
- Medians
- Bridges
- Drainage Features
- Some Pavement Condition
- Sidewalks & Ramps
- Lane Attributes

# Data Extraction

## Other Possible Uses for the Asset Data

- Analysis
- Spatial display and analysis of attributes
- Asset Management
- Engineering
- GIS
- Safety Studies
- Persons With Disabilities  
Compliance Investigations
- Emergency Response
- Legal
- Public Relations

# Data Collection

## Other Possible Uses for the Videolog Data

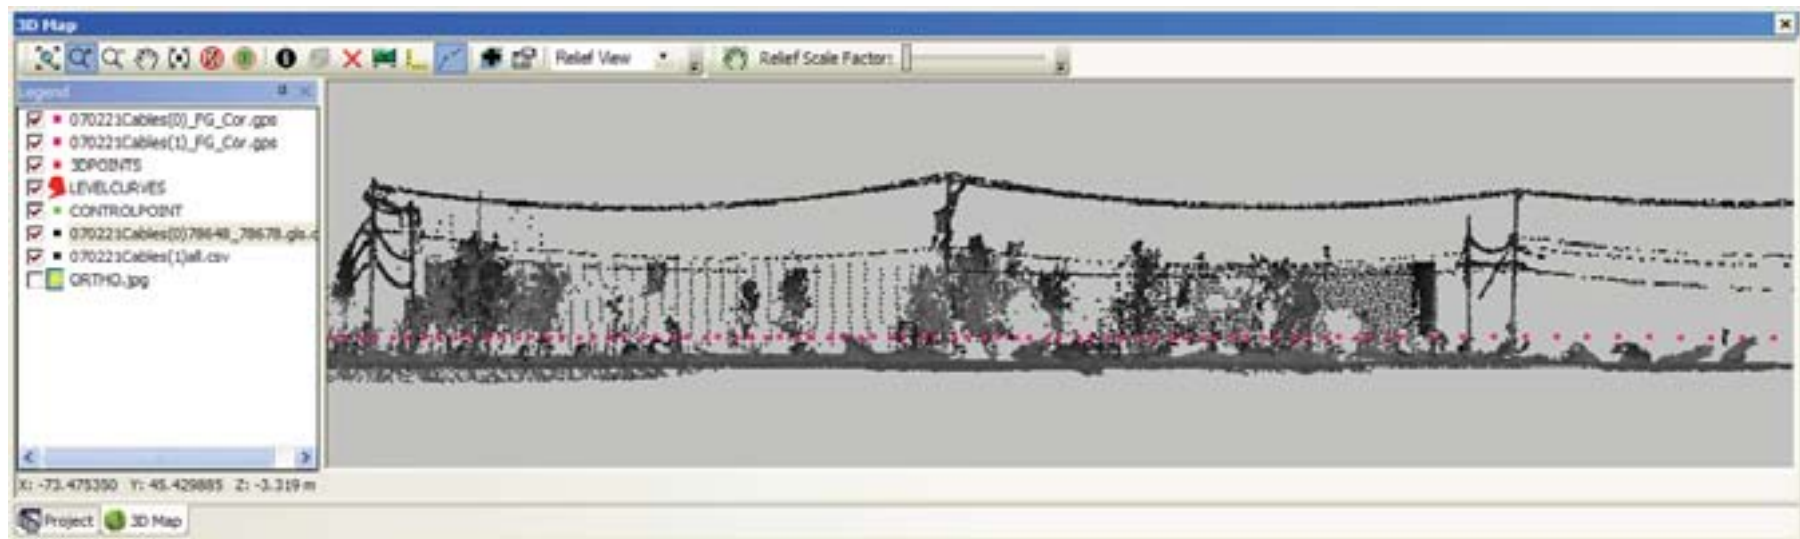

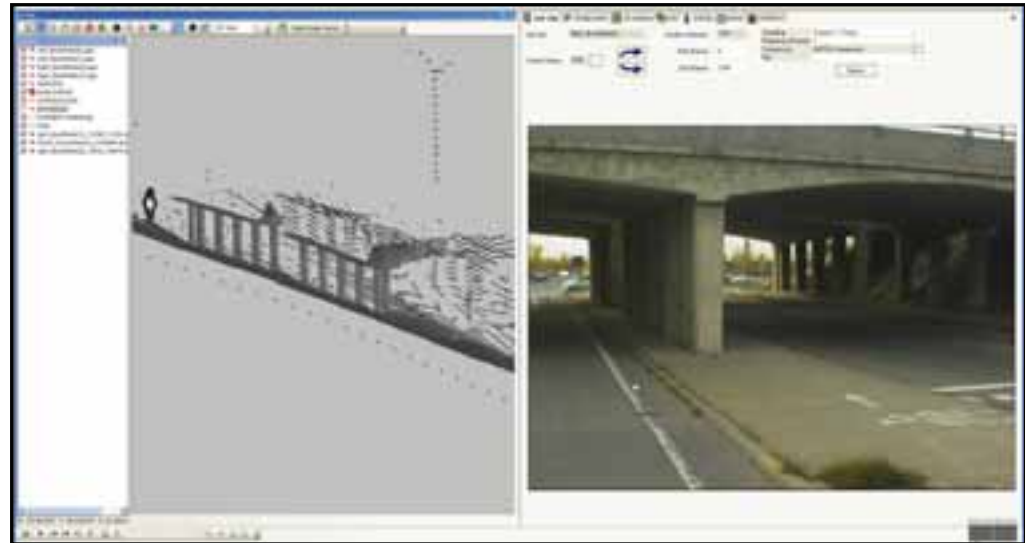

- Linking asset data and images can provide valuable tools to answer questions from customers, Council and management.
- Track customer complaints, service requests and work orders related to individual assets
- Ability to quickly view information regarding assets either visually or in report formats.
- Pavement or asset condition review from the office.
- Pre-plan a trip in the field by reviewing relevant videolog first.

# Data Extraction

## Possible Measurements With LiDAR Data

### Laser Point Clouds

- Pole Heights
- Bridge Clearances
- Sign heights
- Offsets

# Data Extraction

## Data Delivery

Once extracted, all assets were packaged and delivered for input into the data model...

# The Data Model

## What is “The Model”?

- Asset Inventory Database
- Geometric Inventory Database
- Asset and Geometric data from EXCEL spreadsheet Templates
- Develop lifecycle models
- Report asset lifecycle costs over 25-year planning period
- Report geometric deficiencies and recommended improvements
- Develop models to estimate preliminary costs for recommended geometric improvements

# The Data Model

## Purpose

The “Model” will provide a systematic, traceable, defensible, consistent, accountable methodology for decision making support.

- Prescribed / defined method for calculations
- Documented assumptions
- Outputs are reproducible

# The Data Model

## Purpose

### Benefits

- Inventory of assets
- Help to improve cost estimation at the preliminary design stage
- Help to budget / plan for rehabilitation and replacement
- Ability to search by GPS, LHRS or township/station
- Link references (contracts, Project Appraisal Reports, Preliminary Design Reports, pictures, etc.)
- Output annual cost profile over a 25-year span, unconstrained (future assignment to determine constrained)

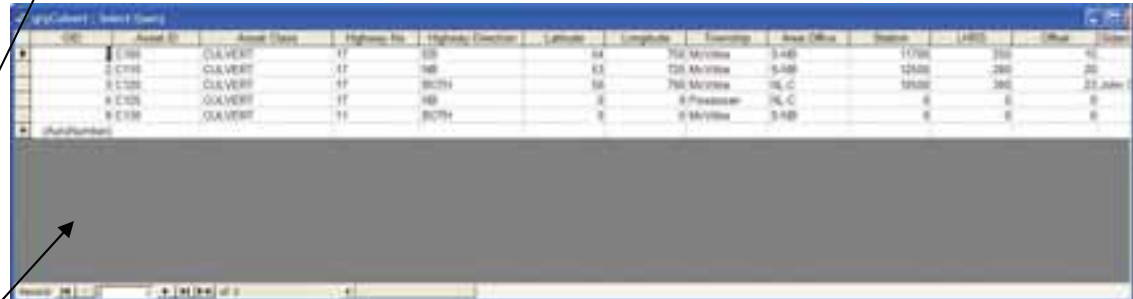

# The Data Model

## Highway Inventory

Asset Feature Sheets

# The Data Model

## Analysis Methodology - Assets

**Need Year** – The year in which an asset is in “need” of treatment

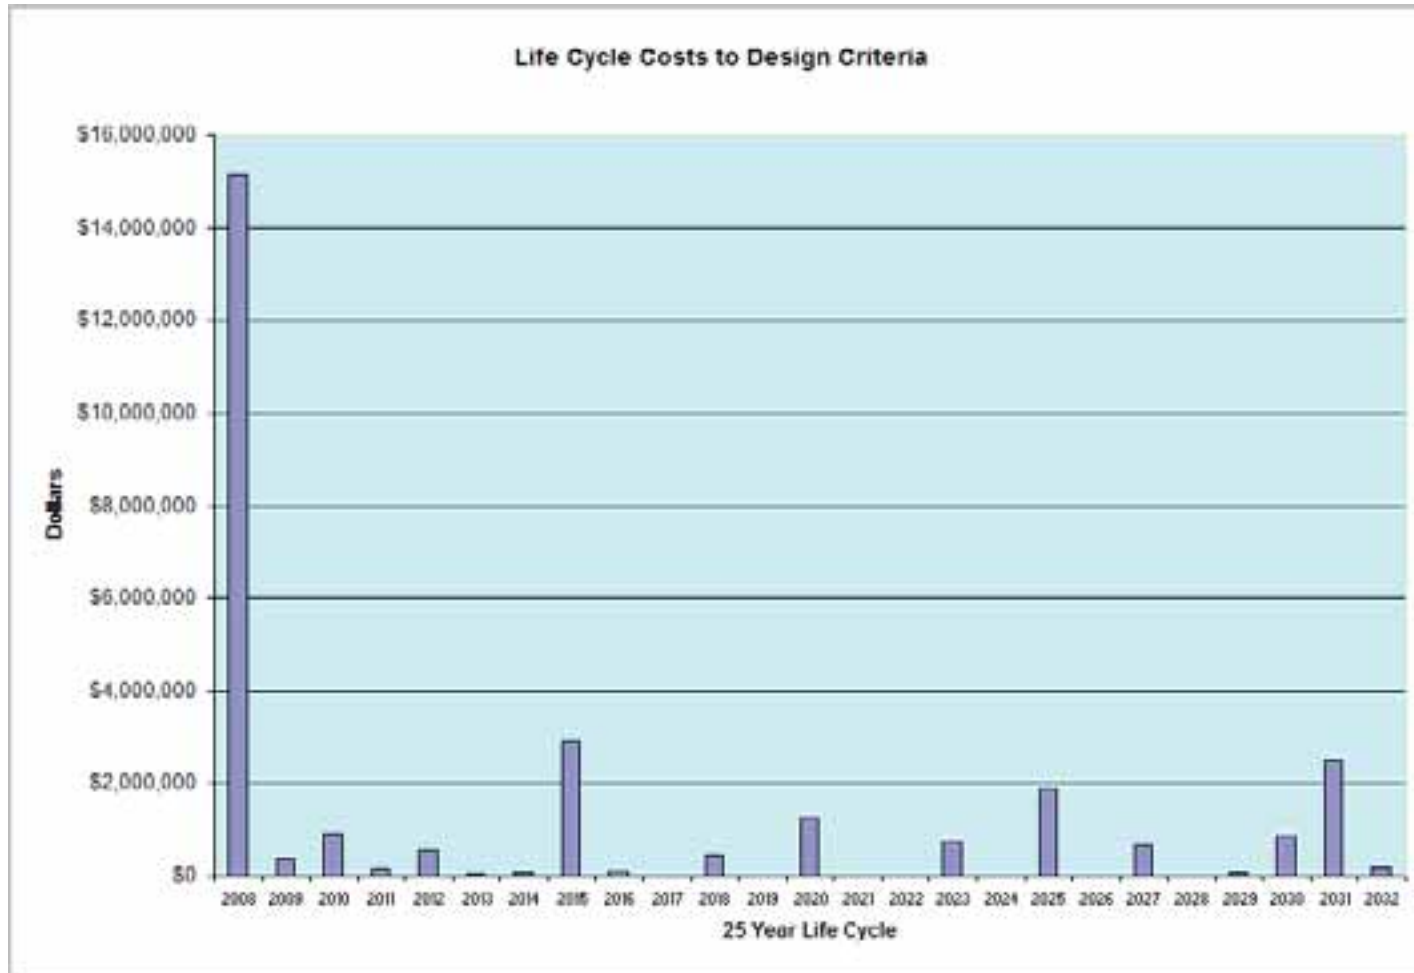

**Treatment** – An intervention (i.e. replacement, repair, improvement or rehabilitation) to extend the life of an asset

# The Data Model

## Model Framework

# The Data Model

## Model Work Flow – How Does It Work?

- Load Geometric and Asset Data
- Update / Maintain Geometric & Asset Data
- Configure the geometric deficiency models
- Configure the asset life cycle deterioration models
- Run analysis to calculate “Need Year” and estimated costs
- Reports – Geometric Deficiency  
Asset Lifecycle

# The Data Model

## Analysis Methodology - Geometrics

**Geometrics** – Geometrics are assessed against current Highway Design Standards. If the existing geometrics are found to be below design standards, the geometric is considered deficient and the “Need Year” is identified as the current year.

**Horizontal Curves** – If the existing radius is less than the minimum radius for the design speed of the highway.

**Vertical Curves** – If the existing K factor is less than the minimum K for the design speed of the highway.

**Rock Cuts** – If the existing clear zone offset is less than the minimum clear zone offset for the design speed of the highway.

# The Data Model

## Analysis Methodology - Geometrics

### Knowledge Sharing

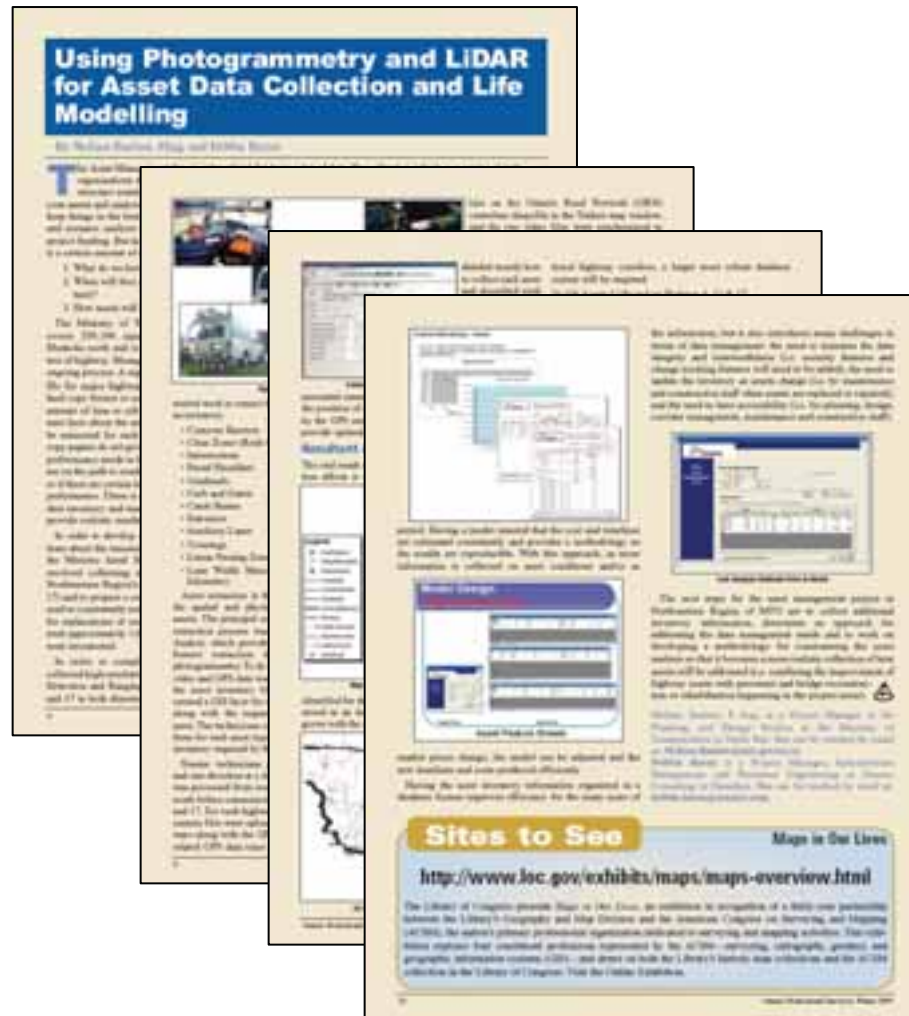

- Multiple users for same information (better relay of information – everyone sees the same thing)
- With improved history tracking we can make better decisions

### Efficiency and Cost Savings

- Use field trips are for verifying inventory rather than recollecting it (save on retyping time and searching time)
- Good opportunity to develop condition database to verify performance
- Develop more consistent and better estimates (improve case for funding)
