**Co-Presenter**

NYSDOT's Oversize/Overweight Vehicle Prescreening Tool was developed to help the transportation industry and the general traveling public with choices in both OS/OW and legal vehicle routing. The system provides users with an interactive map of current bridge restrictions, clearances, postings, and closings. Temporary travel restrictions, such as maintenance or construction projects are collected from NYSDOT's Regional Offices and depicted in the system as well. Users can test the vehicle dimensions and travel dates for their trip against these restrictions.

This session will demonstrate how NYSDOT leveraged existing enterprise systems and GIS framework data to provide a single tool that allows our external customers to screen their proposed routes and our Central Permits Office to review submitted permits.
