

# GPS MAPPING 70K MILES OF LOCAL ROADS IN 5 YEARS

John Hicks, Tennessee Department of Transportation

Thomas Miller, Navstar Mapping Corporation

2012 GIS-T Symposium, Loveland, CO

# CONTRACT DELIVERABLES

- Updated Database Tabular Data
- GPS Center Lines for Local Roads
- Local Road Data Incorporated into State Network
- Audit Files to Track Key Features
- Automated System for TDOT
- Training

# Tennessee Roadway Information Management System (TRIMS)

- Client/Server Application
- Linear Reference System Database (Oracle)
- Roadway Inventory, Structures, Crash, Traffic, Pavement, Photolog, etc.
- Development of Web Based E-TRIMS

# DATABASE TABLES UPDATED

- *Road System* – Parent table; Establishes routes
- *Route Feature* – Event Data
- *Geometrics* – Speed Limits, No. of Lanes, Land Use, 1 or 2 Way Traffic)
- *Roadway Description* – Road Cross Section (Left to Right)
- *Road Segment* – Functional Class, Road Name, In City, etc.)

# LRS SPATIAL NETWORK

- GPS Data Delivered as Text Files
- Geometry created in Oracle using GeoMedia Pro
- Feature for Highway Segments
- Feature for Intersection Records (used as calibration points)
- Production Database Refreshed after Completion

# POST DELIVERY PROCEDURES

- GPS Examination
- TRIMS Data QC Reports
- Create Spatial Network
- Final QA/QC
- Import into TRIMS Database
- TRIMS QA/QC
- Maps Generated and Field Checked

# PROJECT STATUS

- 5 Year Project Ends in August 2012
- Field Data/Post Processing Completed
- Over 67,000 Miles of Roadway Inventory Collected
- Software Enhancements Include Updates to VB10 and Windows 7
- New Horizontal/Vertical Curve and Stop/Passing Sight Distance Data

## LESSONS LEARNED - TDOT

- Do Your Homework and Draft RFP to Include all Requirements
- Test Procedures in Pilot County
- Automation Needed for QA/QC
- Expect and be Ready to Address Unforeseen Hurdles

NAVSTAR MAPPING CORPORATION

# NMC's Process

## Convert TRIMS Data

- Converts 5 export files to 6 working files

## Update TRIMS Data in Field

- Run routes in forward or reverse inventory direction
- Field software displays current data
- Crews record hotkeys and digital voice notes
- Actions stamped with GPS time and DMI logmile values
- Collect continuous GPS and auxiliary sensor data

# NMC Field Inventory Vehicle

- **Dead Reckoning System** allows mapping in areas of GPS blockage
  - Aircraft gyro for heading
  - Barometer for elevation
  - Distance measuring instrument (DMI) for elapsed distance
  - Dead reckoning computer to control the data

## Convert TRIMS Data

- Converts 5 export files to 6 working files

## Update TRIMS Data in Field

- Run routes in forward or reverse inventory direction
- Field software displays current data
- Crews record hotkeys and digital voice notes
- Actions stamped with GPS time and DMI logmile values
- Collect continuous GPS and auxiliary sensor data

## Process Data in Office

- Update data based on the field crews' voice notes
- Generate working files to use in post-processing
- Converge intersections

Voice note example 1:

Voice note example 2:

Voice note example 3:

- Operator performs windshield survey
  - Changes or new features require voice note
  - Unchanged existing TRIMS features are simply tagged
- Edit software plays voice notes automatically

# Edit Software Output Files

- **.CUL** – Contains the feature description information and codes to update the TRIMS Route feature table
- **.GPS** – Contains the final road track records for the route in an NMC working file format as well as a matching record for each record in the .CUL file
- **.G** – Contains the information to update the TRIMS Geometrics table
- **.RD** – Contains the Information to update the TRIMS Roadway Description table

# Intersection Convergence

- Locates matching intersections based on a distance buffer
- Calculates/determines heading values of intersections
- Projects along heading values to a common lat/long value
- Relocates intersections and associated features to the common lat/long value

# Before Intersection Convergence

# After Intersection Convergence

- Converged intersection locations are automatically updated in both routes

## Convert TRIMS Data

- Convert 5 export files to 6 working files

## Update TRIMS Data in Field

- Run routes in forward or reverse inventory direction
- Field software displays current data
- Crews record hotkeys and digital voice notes
- Actions stamped with GPS time and DMI logmile values
- Collect continuous GPS and auxiliary sensor data

## Process Data in Office

- Update data based on the field crews' voice notes
- Generate working files to use in post-processing
- Converge intersections

## Post-Processing

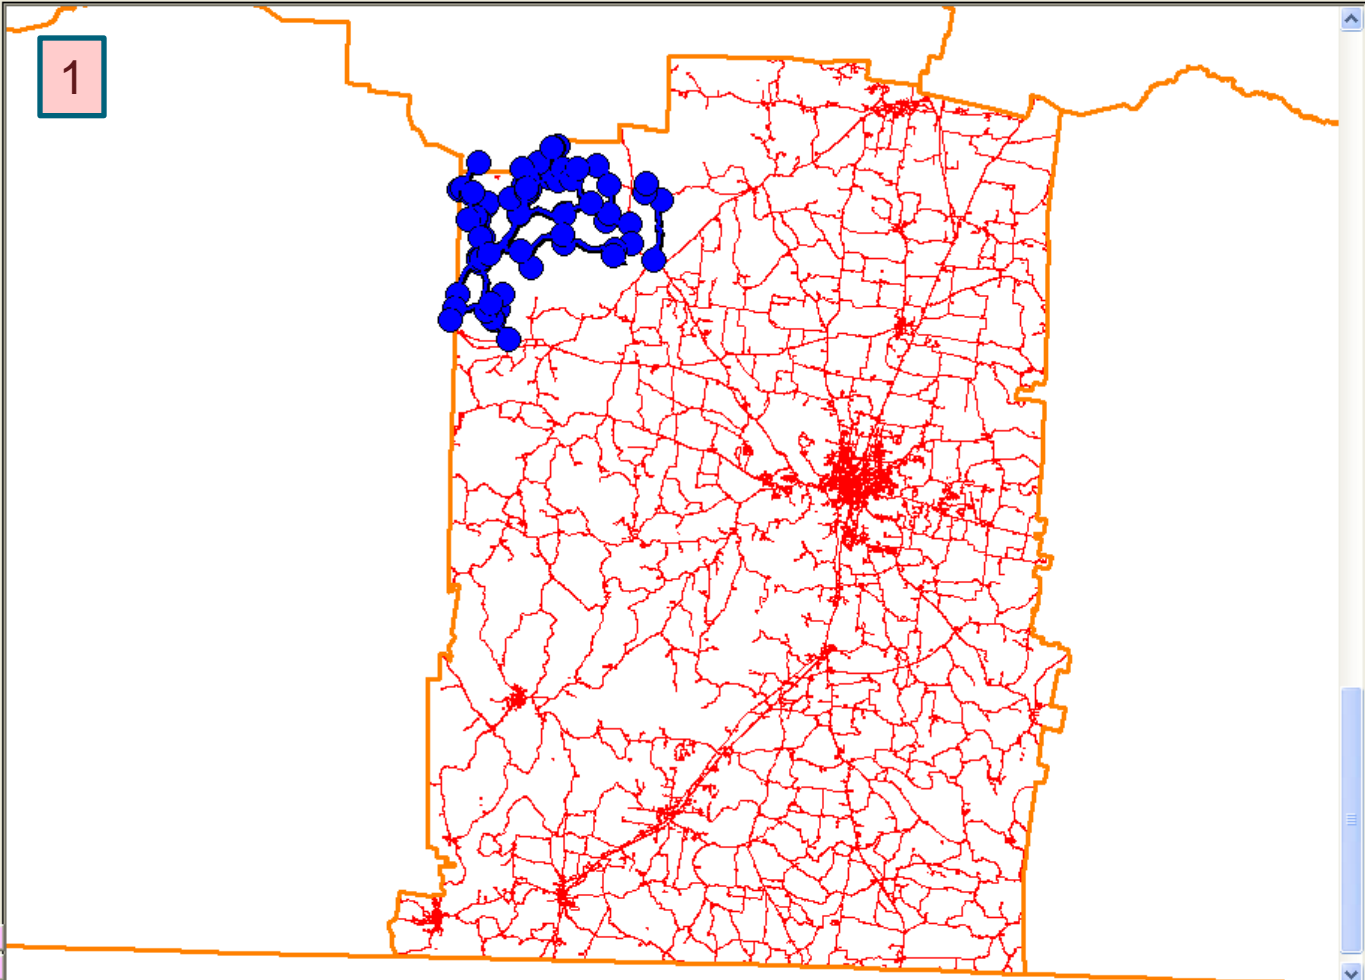

- Verify the integrity of graphics
- Verify integrity of the data that will go back into TRIMS

# Data Quality Assurance

- Software and Audit Files Allow us to Check for:
  - Common edit errors
  - MSLINK numbers
  - Matching intersections
  - Consistent road names
  - Orphan intersections

## Convert TRIMS Data

- Convert five TRIMS export files to six working files

## Update TRIMS Data in Field

- Run routes in forward or reverse inventory direction
- Field software displays current data
- Crews record hotkeys and digital voice notes
- Actions stamped with GPS time and DMI logmile values
- Collect continuous GPS and auxiliary sensor data

## Process Data in Office

- Update data based on the field crews' voice notes
- Generate working files to use in post-processing
- Converge intersections

## Post-Processing

- Verify the integrity of graphics
- Verify integrity of the data that will go back into TRIMS

## Output Data

- Provide TDOT with:
  - Files for graphics generation
  - Five updated TRIMS files in text format

NAVSTAR MAPPING CORPORATION

# Lessons learned

## Field Procedure

- County order
  - Proximity
  - Terrain/time of year
- Contingency plans for inclement weather
- Periodic equipment checks
  - Weekly DMI calibration
  - Frequent tire pressure checks and adjustments

# Office Procedure

- QC data often and early
  - Audit files
  - Swap between vehicles
- County processing times differ
  - New routes, urban vs. rural, coverage
- Always room for improvement
  - Software improvement suggestions
  - Annual review of processing steps

# Project Summary

- Collected, processed, and delivered 67,000 miles of local roads with 2 two-person field crews in 5 years.
- Average data miles collected per day: 67
- 135,000 local roads delivered
