#### Co-Presenter

To support state-wide performance metrics including HPMS reporting and MAP-21 compliance, DOTs must include off-system road networks from local governments in their road model. Several challenges must be addressed including funding, following DOT modeling rules (schema, symbology, accuracy), preventing redundant data capture editing for local governments with GIS, and ensuring off system data meets DOT quality standards. Server-based geospatial technology from Intergraph for roadway asset data collection and maintenance is now available that addresses these challenges. Come learn how to improve off-system road management by local governments to support your state-wide performance metrics.
