Co-Presenter

Whether it's aerial or satellite imagery, DTM or raster map data, large-scale or small-scale data, data from multiple sensor platforms, or data from multiple coordinate systems – image and DTM enterprise solutions can help. Z/I Imaging, with input from DOTs, has created a solution to provide you the data you need when you need it, making it easy for the user to focus on the job instead of how to obtain the data. Instant access to data insures the end user is able to focus on the project and not on where the data is located or if it needs to be translated and that means an improved return on investment. With case studies on implementations at Kansas DOT, Florida DOT and Tennessee DOT, this presentation introduces the data direct to the end-user theme and explores the values, concepts, technologies, and methodologies on DOTs as Enterprises deriving and evolving solutions to maximize the investment expended in acquiring, distributing and maintaining image and DTM data throughout their enterprise.
