Co-Presenter

Working in conjunction with our customers Intergraph is introducing a Roadway Information Management System (I-RIMS) for maintaining, analyzing and disseminating transportation asset information. It has modules geared to all levels of a transportation organization from data maintainers to information analysts to executives.

The method of development employed bridges the gap between generic software and custom one-off projects. This industryware approach to building a state-of-the-art solution combines existing off-the-shelf products with industry best practices developed through customer partnerships and projects to satisfy the transportation Industry's need for managing and reporting on enterprise asset data.
